Data Flow: How data flows between your browser, Taxi for Email and Adobe Campaign

Taxi for Email is hosted in AWS (Amazon Web Services) data centres in Dublin, Ireland. Servers are on a private network with no public ip addresses and multiple levels of firewall. TLS >= 1.2 is supported

Adobe Campaign API information

Taxi connects to the Adobe campaign server using the Adobe campaign soap api:

- This is the same API that is used by the adobe client console
- Documentation relating to the API is available from Adobe
- Connection is via HTTPS/TLS

- Taxi always initiates connection from one of the IP addresses listed here, so these should be white listed in the adobe campaign settings:
 - https://support.emailcms.net/ip_list
- Taxi requires a valid, public SSL certificate to be installed on the adobe campaign server
